sgapiResultsQuestionAverage(%%questionID,%%query = "")

Last Modified on 09/28/2015 1:48 pm EDT

This function returns the average answer of the answers given question ID across all completed surveys in real time.

%%query allows you to optionally specify a query string variable to filter by. Like this: "urlvar_department=support" will return the average value for this question for respondents with the department "support".

Example

This example simply gets the average value for the first question of the survey and displays it.

[Check it out in an Example Survey](#)

```
%%output .= "The average for question 1 is ";
%%output .= sgapiResultsQuestionAverage(2); + ".";
```

Output would be: The average for question 1 is 2.50.
