sgapiSetTableOrderByTable(%%tableID,%%refID,%%language)

This function accepts two table Question IDs and orders the rows of the table in %%tableID by the table in %%refID. This allows you to maintain randomization order across tables in your survey. The row headers for both tables must be identical.

Parameters

- **%%tableID** - The ID of the table you would like to apply randomization to
- **%%refID** - The ID of the table whose randomization you'd like to reference
- **%%language** - This parameter is only necessary in multi-language surveys. Because the script is matching on row header you'll need to run the script for each language. The syntax is like so: %%language="English"

Example

This example script randomizes table ID 12 in the same order as reference table ID 3. The rows for table ID 3 are set up to be randomized within the application.

Check it out in an Example Survey

```
%%table = 12;
%%reftable = 3;

sgapiSetTableOrderByTable(%%table,%%reftable);
```
