

# Performing Basic Math Using Scripting: Add, Subtract, Multiply, and Divide

*Last Modified on 07/15/2016 3:43 pm EDT*

---

Do you need to perform basic math within a response? You can do so using our custom scripting. Because our scripting language is based on PHP any of the operators that are available in PHP are available in our scripting language, and thus, in our surveys! Learn more about [PHP arithmetic operators](#).

This tutorial assumes a basic familiarity with SurveyGizmo and SurveyGizmo Custom Scripting. Check out our [Scripting Documentation](#) to get started!

## Getting Started: Get Familiar with `sgapiGetValue` and `sgapiSetValue`

`sgapiGetValue` and `sgapiSetValue` are your friends when performing math in surveys; get familiar with these functions before you jump into doing math.

`sgapiGetValue`\* returns the value (reporting value) of an answered question (or null, if not answered). Chances are, when performing math in a survey, you'll want to pull one or more values from a question to use in your arithmetic. For single answer questions, a single value is returned. If you are looking to use the value from this can get quite a bit trickier. Check out the [sgapiGetValue Tutorial](#) to learn more.

\*`sgapiGetValue` can be used to pull data from questions on *previous pages*.

`sgapiSetValue`\*\* populates the response value of the given question. Chances are, when performing math in a survey, you'll want to use the result elsewhere in the survey; using `sgapiSetValue` you can store this data in a hidden value or other question for later use/reporting. The `sgapiSetValue` portion of the script below can be used to populate a hidden value, textbox, essay, radio button, drop-down menu, slider and image choice question. If you wish to populate other questions this can get quite a bit trickier. Check out the [sgapiSetValue Tutorial](#) to learn more.

\*\*`sgapiSetValue` can be used to set data in questions on *any page*.

## Example

Let's say, for example you want to multiply the number of shirts the customer orders (entered in a Textbox question in a survey) by the price so you can get a total amount due.

Check it out in a [example survey](#)!

OR

Download a survey with this script to your account.

In the below script we pull the value of the number of shirts Textbox multiply it by the price and set the value of the Total Amount Due Textbox question.

```
%%numberofshirts = sgapiGetValue(5); //Get value of number of shirts Textbox
%%shirtprice = 15; //Amount of shirt

%%totalamountdue = (%%numberofshirts * %%shirtprice); //Simply change the operator
here to perform some other type of arithmetic

sgapiSetValue(6,%%totalamountdue); // ID of Hidden Value or Textbox
```

## Scripting and Other Out-of-the-Box Customizations

We're always happy to help you debug any documented script. That said, we do not have the resources to write scripts on demand.

If you have customization ideas that you haven't figured out how to tackle, we're happy to be a sounding board for SurveyGizmo features and functionality ideas that might meet your customization. Beyond this, you might want to consult with someone on our [Programming Services Team](#); these folks might have the scripting chops to help you to achieve what you are looking for!
